Title: Stomach cancer study

Publication Date: 5/29/2008

Text Extract: In 2001, a study showed the stomach cancer patients have a much better prognosis after surgery if they get follow up chemotherapy and radiation. **OHSU** wanted to see whether patients were getting that treatment. The new **OHSU** study finds an increased number of surgery patients get the treatment after surgery, but many still don't. Dr. Kevin Billingsley says they think age might be a reason, but it will require more study ...

Best care eludes cancer patients

Adding chemotherapy and radiation improves survival after stomach cancer surgery; but two-thirds of patients in Oregon aren't getting the combination treatment, a new study shows.

"It appears practitioners are slow to adopt new standards of care," said co-author Dr. Charles Thomas of Oregon Health & Science University.

Researchers used the Oregon State Cancer Registry to compare the treatments given to more than 300 patients. They found that 33 percent of patients received chemotherapy and radiation, up from 14.2 percent before 2001, when a pivotal study showed that the follow-up treatment saves lives and prevents relapses.

Lead author Dr. Kristian Enestvedt of OHSU said he was surprised to find so many patients going without the "gold standard" treatment.

The study is one of many highlighting gaps in quality. Dr. David Shute, a Portland physician involved in quality improvement efforts, said asking doctors plenty of questions can help patients get better care. Before surgery or other complicated treatments, Shute advises patients to get a second opinion.

Best care eludes cancer patients

Adding chemotherapy and radiation improves survival after stomach cancer surgery, but hundreds of patients in Oregon aren't getting the combination treatment, a new study shows.

"It appears practitioners are slow to adopt new standards of care," said co-author Dr. Charles Thomas of Oregon Health & Science University.

Researchers used the Oregon State Cancer Registry to compare the treatments given to more than 300 patients. They found that 23 percent of patients received chemotherapy and radiation, up from 14.2 percent before 2003, when a similar study showed that the follow-up treatment saves lives and prevents relapses.

Lead author Dr. Kirrhan Overholt of OHSU said he was surprised to find so many patients going without the "gold standard" treatment.

The study is one of many highlighting gaps in quality. Dr. David Skolnik, a Portland physician involved in quality improvement efforts, said asking doctors about quality standards can help patients get better care before surgery or other complicated treatments. Skolnik advises patients to get a second opinion.
