**L1: OPAL-K INSOMNIA ASSESSMENT & TREATMENT FLOW CHART**

**Identify possible causes of insomnia: behavioral factors, environmental factors, medical illness or medications, psychiatric disorders or substance abuse**

**Behavioral Insomnia of Childhood Criteria:**
- Falling asleep is an extended process
- Sleep onset associations are highly problematic and demanding
- In the absence of associated conditions sleep is delayed
- Nighttime awakenings require caregiver intervention
- The child has difficulty initiating or maintaining sleep
- Child stalls or refuses to go to bed
- The caregiver demonstrates insufficient or inappropriate limit setting
- The sleep problem is not better explained by medical, psychiatric, medication, or neurological factors

**Environmental Causes:**
- Poor sleep milieu (noise, bright light, etc.)
- Poor sleep hygiene
- Family mental illness/Substance use disorder
- Too much caffeine

**Trauma:**
- Abuse or neglect
- Domestic Violence
- Being bullied at school
- Cyberbullying

**Psychiatric Disorders:**
- ADHD
- PTSD
- Bipolar Disorder
- Substance use disorders
- Anxiety Disorder
- Major Depression
- Adjustment Reaction
- Psychotic Disorder
- Obsessive Compulsive Disorder (OCD)
- Tic Disorders

**Medical or Medication Causes:**
- Delayed Sleep phase syndrome (DSPS)
- Restless Leg syndrome (RLS)
- Asthma
- Cystic Fibrosis
- Pain syndromes
- Cancer
- Rheumatic Disorders
- Medication side-effects
- Parasomnias and Obstructive sleep apnea

**Parental and youth coaching**
- Establish a consistent bedtime routine that does not include stimulating activities, such as television viewing or video games
- Introduce more appropriate sleep associations that will be readily available to the child during the night, such as use of a transitional object (e.g., blanket, stuffed animal)
- Encourage development of self-soothing skills, that is having children fall asleep independently at bedtime without parental presence
- Practice bedtime fading, which involves temporarily setting the child’s bedtime to the current sleep-onset time and then gradually advancing bedtime
- Decrease parental attention for problematic bedtime behaviors, such as stalling and additional requests
- Provide positive reinforcement for appropriate behaviors, such as stickers for remaining in bed
- Teach self-relaxation techniques and cognitive-behavioral strategies, which can also be beneficial in older children.

**Eliminate/Ameliorate Environmental Causes:**
- Remove stimulating electronic media from bedrooms
- Organize sleeping area to eliminate excessive noise or light
- No caffeinated beverages
- Address family mental health issues/substance problems and make appropriate referrals
- Address domestic violence issues and make appropriate referrals
- Identify abuse and or bullying and collaborate with mental health professional/school on devising a safety plan

**ADHD Insomnia – treat with alpha 2 agonist. Consider evening dose of stimulant for rebound**

**Depression Insomnia – treatment with antidepressant consider mirtazapine or doxepin if SSRI does not resolve insomnia**

**Anxiety related insomnia – treat with hydroxyzine or alpha 2a agonists and or SSRI**

**PTSD insomnia – alpha 2a agonists or prazosin if alpha 2as ineffective**

**Psychosis/Mania – antipsychotics**

**Substance use disorders – abstinence, clonidine can help with withdrawal syndromes**

**OCD- SSRI, Cognitive Behavioral Therapy**

**Tic Disorders- alpha 2a agonists, antipsychotics**
L2: EVALUATION FOR PEDIATRIC INSOMNIA

- Consider sleep disorders in the differential diagnosis when evaluating children and adolescents with cognitive, emotional and behavioral problems.
- Screen all children and adolescents for OSA by asking parents about snoring, apnea, and labored breathing.
- Ask screening questions for narcolepsy, e.g., cataplexy, sleep paralysis, and hypnagogic hallucinations.
- Carefully assess sleep schedules and sleep amounts on weekdays, weekends and school holidays. Consider use of a sleep diary.
- Remember that insufficient sleep is the most common cause of excessive daytime sleepiness (EDS).
- Assess bedtime routines and sleep-onset associations especially in younger children with behaviorally based sleep disorders.
- Conduct a physical exam particularly assessing risk factors for Obstructive sleep apnea (OSA) such as craniofacial anomalies, tonsillar size, septal deviation of the nose.

L4: OPAL-K Sleep Disorders Treatment Guidelines

- There are no medications FDA approved for pediatric insomnia.
- Use sleep hygiene education and behavioral interventions first, (80%-90% of Behavioral Insomnia resolves with behavioral/environmental interventions) before considering use of medications or naturopathic interventions.
- Youth with psychiatric illness and insomnia should have their psychiatric illness adequately treated before considering use of sleep medications or naturopathic interventions.
- More complex psychosocial causes of insomnia may need a multidisciplinary team to adequately address problems such as domestic violence, bullying and substance abuse in the home.
- Refer suspected cases of Obstructive Sleep Apnea syndromes (OSAS) and narcolepsy to a sleep center for further assessment with Polysonography (PSG) and/or Multiple Sleep Latency Test (MSLT).
- The treatment of choice for OSAS is adenotonsillectomy. Continuous Positive Airway Pressure (CPAP) can be used if surgery is not possible or if OSAS persists after adenotonsillectomy.
- A follow-up polysomnogram should be done in any child continuing to have OSAS symptoms after adenotonsillectomy.
- Delayed Sleep Phase Syndrome (DSPS) is common and can be readily treated with chronotherapy, light therapy and potentially melatonin as long as the patient is motivated.
- Educate parents and the youth on sleep needs and hygiene and refer them to appropriate sources of information (see Suggested Readings).
- Treat Parasomnias with reassurance and safety measures, using benzodiazepines sparingly for severe, potentially dangerous cases.
- Behavioral interventions are the treatment of choice for young children with bedtime struggles and frequent awakenings. Resist using medications unless the child is neuro-developmentally compromised and unresponsive to behavioral treatments.
Use non-medical interventions (refer to treatment table)

Meds not indicated

Nonmedical interventions have failed

Use an Over-the-Counter (OTC) or non-prescription medication first such as: melatonin, or diphenhydramine (Benadryl)

Prescription medications: hydroxyzine (Vistaril), or Trazodone (Desyrel). When psychiatric disorder present consider using alpha 2a agonist for ADHD, atypical antipsychotics for bipolar or psychotic disorders, mirtazapine for depression.

Obtain OPAL-K consultation to use other meds or refer to child psychiatrist for treatment

L7: Sleep Hygiene Checklist for Families with Children Who Can’t Sleep

Living with a child who can’t sleep can be very frustrating and at times overwhelming. The following checklist can help families become more effective in managing the behavior issues associated with children with sleep problems.

Checklist for parents:
- The American Academy of Pediatrics recommends that children should not have televisions, video game electronics, or electronic media residing in their room.
- Help your child keep a consistent bedtime and wake time every day of the week. Late weekend nights or sleeping in till noon can disrupt school night bedtimes.
- Make sure the schedule includes exercise, when to sleep, and when to eat, not too late at night.
- Avoid letting your child spend lots of awake time in their bed. Spending lots awake or time in bed may prevent the bed from being associated with sleeping.
- Bedrooms should be comfortable and not be too warm or cool. Excessive lights or noise in or near the bedroom environment should be eliminated at bedtime.
- Remove clocks from bedrooms of children who tend to stare or ruminate about the clock.

Checklist for younger children:
- Avoid highly stimulating or scary play, television shows, or movies just before bedtime.
- Children should be put in bed when they are drowsy, but still awake.
- Avoid allowing young children to fall asleep in any other places except their bed. Letting them fall asleep other places can form habits that are hard to break.
- If a child does not fall asleep within 20 minutes, they should be taken out of bed and engaged in low stimulation activities like reading until drowsy and then return to bed.
- When checking to see if young children are asleep, minimize any stimulation or talking.
- If you child is never drowsy at bedtime, try rescheduling bedtime later in the evening, after consistent sleep patterns arise then bedtime should be gradually advanced earlier until the desired bed time is reached.
- Sometimes providing a security or transitional object liked a stuffed animal or special blanket helps young children feel more relaxed and ready to sleep.

Checklist for older child:
- Make sure you don’t eat chocolate or drink, energy drinks, coffee, caffeinated soda, or black tea.
- Try to exercise everyday, this will help you sleep better, but don’t exercise just prior to going to bed.
- Make a bedtime routine and schedule and try hard to stick with it every night.
- If you are unable to sleep because of lots of worry devise a plan with your parents, doctor or therapist.
- Avoid using any electronic media entertainment or texting or internet activities at bedtime or late at night.
- Get your doctor of therapist to help you learn relaxation techniques such as deep breathing or guided imagery to help you get ready for sleeping.
- Have a plan for engaging in quiet activities if you have been wide-awake over 20 minutes, then retry to sleep when drowsy.
- Keep a sleep diary to track naps, sleep times, and other activities to find patterns and target problem areas for change when sleep patterns are bad.
- Use Sleep Hygiene Suggestions list
