Have you ever wondered....

What is ADHD & ADD?
What causes it and how do we assess it?
Do heart-rate and brain activity play a part?

Help us study it!

THE ADHD RESEARCH STUDY:

♥ One screening visit at OHSU
♥ It may involve 2 testing visits for 3 years
♥ One heart-rate testing visit and/or one brain imaging testing visit (plus a “practice” visit)
♥ Each visit lasts 2-3 hours; siblings may be eligible
♥ If your child takes stimulant medication for ADHD/ADD, they must be off that medication for testing visits
♥ Diagnostic feedback and compensation given

THE ADHD RESEARCH STUDY

FAQ’s

I think my child may have ADHD or ADD, can we participate in the study?
Yes! We are recruiting children that are diagnosed or suspected of having ADHD/ADD.

Will you offer feedback?
Yes! We offer all families clinical feedback.

What is a longitudinal study?
A longitudinal study observes participants over a period of time. This type of study allows more accurate and in-depth information to be evaluated.

What about heart rate?
Heart rate is measured using sensors and a computer system. It’s non-invasive and safe for all ages.

What is brain imaging?
A brain image is obtained using a magnetic resonance imaging (MRI) scanner. It is a non-invasive machine that takes a picture of your brain. No radiation. No injections. It is safe for all ages. Your child will receive a picture of their brain!

Are you giving medications as part of this study?
No, this is not a medication study.

PARTICIPATING CHILDREN

- Ages 7 to 11
- In good health either diagnosed or suspected with ADHD/ADD.
- Parents will also participate
- If taking a stimulant medication for ADHD/ADD, they must be off that medication for the testing visits
- Siblings may be eligible too!
- All information received is kept strictly confidential
- Appointments available evenings and Saturdays

STUDY OBJECTIVES

- To learn about the different types of ADHD & ADD
- Combine existing ADHD/ADD assessments with newer measures to further understand and predict attentional development
- Learn if heart-rate plays a part in the assessment
- Learn if size and activity of certain brain structures relates to ADHD/ADD
- Follow 7 to 11 year old children for three years to see how the assessments measure up over time
