

University Center for Excellence in Developmental Disabilities

National Core Indicators (NCI) is a project that gathers health information and a standard set of performance and outcome measures. Oregon is one of 46 states which uses this data to determine services for health and quality of life for individuals experiencing intellectual and developmental disabilities (IDD). The indicators are intended to provide a system-level “snapshot” of how well each state is performing relative to other states, to track their own performance over time, and to establish national benchmarks. Other states use NCI data for a variety of policy development, quality assurance, and strategic planning activities.

Last year in 2017, we interviewed 412 Oregonians across the state. Here is a sample of those results:

Respondents had a flu vaccine in the past year:

50% of respondents said they wanted more help making friends or keeping friends, compared to the national average of **41%**.

16% of respondents reported feeling lonely *often*, compared to the national average of **11%**.

Additional Services Needed Most

- 21%** Education & Training
- 20%** Job Support Services
- 19%** Transportation
- 18%** Social/Relationship Support

Respondents had the opportunity to vote:
