Common Truncus/Truncus Arteriosus or TA

Truncus arteriosus (TA) (ˈtrəŋ-kəs är-ˌtir-ē-ˈō-səs), also called common truncus, is a rare congenital heart defect (the baby is born with it) in which a single shared tube for carrying blood comes out of the heart, instead of the usual two separate ones. In the normal heart, one tube, the aorta, comes out of the left side of the heart and takes blood to the body. The other tube, the pulmonary artery, comes out of the right side of the heart to take blood to the lungs to get oxygen. Having TA means that oxygen-poor blood that should go to the lungs and oxygen-rich blood that should go to the rest of the body are mixed together. In babies with TA, there is also usually a hole between the two lower chambers of the heart known as a ventricular septal defect. Truncus arteriosus occurs in less than one out of every 10,000 live births. It can occur by itself or as part of certain genetic disorders. There are about 300 cases of truncus arteriosus per year in the United States. To learn more about TA, visit the Centers for Disease Control and Prevention’s website tinyurl.com/y7ye86b8.

This Family Resource Page was supported by a Cooperative Agreement (DD004951) funded by the Centers for Disease Control and Prevention to the Oregon Health Authority (OHA) (6NU50DD004951-01-01). This project is a joint effort of the OHA’s Birth Anomalies Surveillance System and the Oregon Center for Children and Youth with Special Health Needs’ Family to Family Health Information Center at OHSU. The generous support and collaboration of the OHA and Community Partners is appreciated.
