Identify possible causes of insomnia: behavioral factors, environmental factors, medical illness or medications, psychiatric disorders or substance abuse

Behavioral Insomnia of Childhood Criteria: 1) Falling asleep is an extended process 2) Sleep onset associations are highly problematic and demanding 3) In the absence of associated conditions sleep is delayed 4) Nighttime awakenings require caregiver intervention 5) The child has difficulty initiating or maintaining sleep 6) Child stalls or refuses to go to bed 7) The caregiver demonstrates insufficient or inappropriate limit setting 8) The sleep problem is not better explained by medical, psychiatric, medication, or neurological factors

Environmental Causes:
- Poor sleep milieu (noise, bright light, etc.)
- Poor sleep hygiene
- Family mental illness/Substance use disorder
- Too much caffeine

Trauma:
- Abuse or neglect
- Domestic Violence
- Being bullied at school
- Cyberbullying

Psychiatric Disorders:
- ADHD
- PTSD
- Bipolar Disorder
- Substance use disorders
- Anxiety Disorder
- Major Depression
- Adjustment Reaction
- Psychotic Disorder
- Obsessive Compulsive Disorder (OCD)
- Tic Disorders

Parental and youth coaching
1) Establish a consistent bedtime routine that does not include stimulating activities, such as television viewing
2) Introduce more appropriate sleep associations that will be readily available to the child during the night, such as use of a transitional object (e.g., blanket, stuffed animal)
3) Encourage development of self-soothing skills, that is having children fall asleep independently at bedtime without parental presence
4) Practice bedtime fading, which involves temporarily setting the child’s bedtime to the current sleep-onset time and then gradually advancing bedtime
5) Decrease parental attention for problematic bedtime behaviors, such as stalling and additional requests
6) Provide positive reinforcement for appropriate behaviors, such as stickers for remaining in bed
7) Teach self-relaxation techniques and cognitive-behavioral strategies, which can also be beneficial in older children.

Eliminate/Ameliorate Environmental Causes:
1) Remove stimulating electronic media from bedrooms
2) Organize sleeping area to eliminate excessive noise or light
3) No caffeinated beverages
4) Address family mental health issues/substance problems and make appropriate referrals
5) Address domestic violence issues and make appropriate referrals
6) Identify abuse and or bullying and collaborate with mental health professional/school on devising a safety plan

ADHD Insomnia – treat with alpha 2 agonist. Consider evening dose of stimulant for rebound
Depression Insomnia – treatment with antidepressant consider mirtazapine or doxepin if SSRI does not resolve insomnia
Anxiety related insomnia – treat with hydroxyzine or alpha 2a agonists and or SSRI
PTSD insomnia – alpha 2a agonists or prazosin if alpha 2as ineffective
Psychosis/Mania – antipsychotics
Substance use disorders – abstinence, clonidine can help with withdrawal syndromes
OCD- SSRI, Cognitive Behavioral Therapy
Tic Disorders- alpha 2a agonists, antipsychotics

ADHD – usually treated with shifting internal clock using strict schedule, light therapy in AM, not light exposure at night, melatonin
Restless Leg Syndrome – eliminate (caffeine, nicotine, antihistamines, SSRIs), exercise, and treat possible underlying causes like anemia
Asthma, Cystic Fibrosis – Treat underlying disorder and causes of air hunger
Pain syndromes from Rheumatic Disorders and cancer - treatment of underlying disease and proper pain control
Parasomnias & Obstructive sleep apnea - refer to sleep specialist
2: OPAL-K Sleep Disorders Treatment Guidelines

- There are no medications FDA approved for pediatric insomnia.
- Use sleep hygiene education and behavioral interventions first, (80%-90% of Behavioral Insomnia resolves with behavioral/environmental interventions) before considering use of medications or naturopathic interventions
- Youth with psychiatric illness and insomnia should have their psychiatric illness adequately treated before considering use of sleep medications or naturopathic interventions.
- More complex psychosocial causes of insomnia may need a multidisciplinary team to adequately address problems such as domestic violence, bullying and substance abuse in the home
- Refer suspected cases of Obstructive Sleep Apnea syndromes (OSAS) and narcolepsy to a sleep center for further assessment with Polysomnography (PSG) and/or Multiple Sleep Latency Test (MSLT).
- The treatment of choice for OSAS is adenotonsillectomy. Continuous Positive Airway Pressure (CPAP) can be used if surgery is not possible or if OSAS persists after adenotonsillectomy.
- A follow-up polysomnogram should be done in any child continuing to have OSAS symptoms after adenotonsillectomy.
- Delayed Sleep Phase Syndrome (DSPS) is common and can be readily treated with chronotherapy, light therapy and potentially melatonin as long as the patient is motivated.
- Educate parents and the youth on sleep needs and hygiene and refer them to appropriate sources of information (see Suggested Readings).
- Treat Parasomnias with reassurance and safety measures, using benzodiazepines sparingly for severe, potentially dangerous cases.
- Behavioral interventions are the treatment of choice for young children with bedtime struggles and frequent awakenings. Resist using medications unless the child is neuro-developmentally compromised and unresponsive to behavioral treatments.
3: OPAL-K Evaluation for Pediatric Insomnia

- Consider sleep disorders in the differential diagnosis when evaluating children and adolescents with cognitive, emotional and behavioral problems.
- Screen all children and adolescents for OSA by asking parents about snoring, apnea, and labored breathing.
- Ask screening questions for narcolepsy, e.g., cataplexy, sleep paralysis, and hypnagogic hallucinations.
- Carefully assess sleep schedules and sleep amounts on weekdays, weekends and school holidays. Consider use of a sleep diary.
- Remember that insufficient sleep is the most common cause of excessive day time sleepiness (EDS).
- Assess bedtime routines and sleep-onset associations especially in younger children with behaviorally based sleep disorders.
- Conduct a physical exam particularly assessing risk factors for Obstructive sleep apnea (OSA) such as craniofacial anomalies, tonsillar size, septal deviation of the nose.
4: BEARS Screening Algorithm

The "BEARS" instrument is divided into five major sleep domains, providing a comprehensive screen for the major sleep disorders affecting children in the 2- to 18-year old range. Each sleep domain has a set of age-appropriate "trigger questions" for use in the clinical interview.

- **B** = bedtime problems
- **E** = excessive daytime sleepiness
- **A** = awakenings during the night
- **R** = regularity and duration of sleep
- **S** = snoring

### Examples of developmentally appropriate trigger questions:

<table>
<thead>
<tr>
<th>Domain</th>
<th>Toddler/preschool (2-5 years)</th>
<th>School-aged (6-12 years)</th>
<th>Adolescent (13-18 years)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>1. Bedtime problems</strong></td>
<td>Does your child have any problems going to bed? Falling asleep?</td>
<td>Does your child have any problems at bedtime? (P) Do you have any problems going to bed? (C)</td>
<td>Do you have any problems falling asleep at bedtime? (C)</td>
</tr>
<tr>
<td><strong>2. Excessive daytime sleepiness</strong></td>
<td>Does your child seem overtired or sleepy a lot during the day? Does she still take naps?</td>
<td>Does your child have difficulty waking in the morning, seem sleepy during the day or take naps? (P) Do you feel tired a lot? (C)</td>
<td>Do you feel sleep a lot during the day? In school? While driving? (C)</td>
</tr>
<tr>
<td><strong>3. Awakenings during the night</strong></td>
<td>Does your child wake up a lot at night?</td>
<td>Does your child seem to wake up a lot at night? Any sleepwalking or nightmares? (P) Do you wake up a lot at night? Have trouble getting back to sleep? (C)</td>
<td>Do you wake up a lot at night? Have trouble getting back to sleep? (C)</td>
</tr>
<tr>
<td><strong>4. Regularity and duration of sleep</strong></td>
<td>Does your child have a regular bedtime and wake time? What are they?</td>
<td>What time does your child go to bed and get up on school days? Weekends? Do you think he/she is getting enough sleep? (P)</td>
<td>What time do you usually go to bed on school nights? Weekends? How much sleep do you usually get? (C)</td>
</tr>
<tr>
<td><strong>5. Snoring</strong></td>
<td>Does your child snore a lot or have difficult breathing at night?</td>
<td>Does your child have loud or nightly snoring or any breathing difficulties at night? (P)</td>
<td>Does your teenager snore loudly or nightly? (P)</td>

5 - 6: CHILDREN’S SLEEP HABITS QUESTIONNAIRE (ABBREVIATED)

The following statements are about your child’s sleep habits and possible difficulties with sleep. Think about the past week in your life when you answer the questions. If last week was unusual for a specific reason, choose the most recent typical week. Unless noted, check Always if something occurs every night, Usually if it occurs 5 or 6 times a week, Sometimes if it occurs 2 to 4 times a week, Rarely if it occurs once a week, and Never if it occurs less than once a week.

**BEDTIME**

Write in your child’s usual bedtime: Weeknights _____:____ am/pm  
Weekends _____:____ am/pm

<table>
<thead>

</table>
7: Mindell's Sleep Hygiene Suggestions for Older Children

1. Choose a set wake-up time. Wake up at the same time every day, no matter how much sleep you got the night before.

2. Choose a bedtime. Choose the earliest possible bedtime that enables you to get the sleep you need. However, too much time in bed will lead to lighter, more interrupted sleep, so an appropriate bedtime is one that enables you to get the sleep that you need but doesn't let you be in bed too long. You only want to spend the amount of time in bed that you actually need for sleep.

3. Go to bed when you are sleepy, but not before your chosen bedtime. Don't go to bed until you are sleepy. So if you are still wide-awake at your chosen bedtime, wait a while longer until you are sleepy enough to fall asleep quickly.

4. Get out of bed when you can't sleep. If you are lying in bed and can't sleep, get out of bed and do something relaxing out of the bedroom. Read a book, watch television, or do something else relaxing; then go back to bed when you feel sleepy enough to fall asleep quickly. Again, if you do not fall asleep quickly, get up. Keep repeating this cycle until you fall asleep. You need to get out of bed when you can't sleep both at bedtime and in the middle of the night.

5. Don't worry or plan in bed. When lying in bed at night, don't spend the time worrying or planning for the next day. Set aside another time of the day to do these things. If you automatically start thinking and worrying when you get in bed, get up and don't head back to bed until your thoughts won't interfere with falling asleep. Thinking in bed is a habit, and one that you can break.

6. Only use your bed for sleep. Don't do anything but sleep in your bed. That is, don't do other activities, such as eat, watch television, or [do homework].

7. Avoid naps. Naps will interfere with your ability to fall asleep at bedtime, so no naps.

From Mindell JA, Owens JA. Clinical guide to pediatric sleep: diagnosis and management of sleep problems, 2nd edition. Philadelphia: Lippincott Williams & Wilkins; 2009; with permission.
8: OPAL-K Sleep Medication Algorithm (v.101514)

**Premedication Stage**

Diagnostic evaluation and parent education regarding non-medical and medication treatments

Meds not indicated → Use non-medical interventions (refer to treatment table)

Nonmedical interventions have failed

**Med-Trial 1**

Use an Over-the-Counter (OTC) or non-prescription medication first such as: melatonin, or diphenhydramine (Benadryl)

Meds effective → Continue Treatment Regimen

First OTCs ineffective, discontinue.

**Med-Trial 2**

Prescription medications: hydroxyzine (Vistaril), or Trazodone (Desyrel). When psychiatric disorder present consider using alpha 2a agonist for ADHD, atypical antipsychotics for bipolar or psychotic disorders, mirtazapine for depression.

Meds effective → Continue Treatment Regimen

Meds ineffective.

Obtain OPAL-K consultation to use other meds or refer to child psychiatrist for treatment

10: Sleep Hygiene Checklist for Families with Children Who Can’t Sleep

Living with a child who can’t sleep can be very frustrating and at times overwhelming. The following checklist can help families become more effective in managing the behavior issues associated with children with sleep problems.

**Checklist for parents:**
- The American Academy of Pediatrics recommends that children should not have televisions, video game electronics, or electronic media residing in their room.
- Help your child keep a consistent bedtime and wake time every day of the week. Late weekend nights or sleeping in till noon can disrupt school night bedtimes.
- Make sure the schedule includes exercise, when to sleep, and when to eat, not too late at night.
- Avoid letting your child spend lots of awake time in their bed. Spending lots awake or time in bed may prevent the bed from being associated with sleeping.
- Bedrooms should be comfortable and not be too warm or cool. Excessive lights or noise in or near the bedroom environment should be eliminated at bedtime.
- Remove clocks from bedrooms of children who tend to stare or ruminate about the clock.

**Checklist for younger children:**
- Avoid highly stimulating or scary play, television shows, or movies just before bedtime.
- Children should be put in bed when they are drowsy, but still awake.
- Avoid allowing young children to fall asleep in any other places except their bed. Letting them fall asleep other places can form habits that are hard to break.
- If a child does not fall asleep within 20 minutes, they should be taken out of bed and engaged in low stimulation activities like reading until drowsy and then return to bed.
- When checking to see if young children are asleep, minimize any stimulation or talking.
- If you child is never drowsy at bedtime, try rescheduling bedtime later in the evening, after consistent sleep patterns arise then bedtime should be gradually advanced earlier until the desired bed time is reached.
- Sometimes providing a security or transitional object liked a stuffed animal or special blanket helps young children feel more relaxed and ready to sleep.

**Checklist for older child:**
- Make sure you don’t eat chocolate or drink, energy drinks, coffee, caffeinated soda, or black tea.
- Try to exercise everyday, this will help you sleep better, but don’t exercise just prior to going to bed.
- Make a bedtime routine and schedule and try hard to stick with it every night.
- If you are unable to sleep because of lots of worry devise a plan with your parents, doctor or therapist.
- Avoid using any electronic media entertainment or texting or internet activities at bedtime or late at night.
- Get your doctor of therapist to help you learn relaxation techniques such as deep breathing or guided imagery to help you get ready for sleeping.
- Have a plan for engaging in quiet activities if you have been wide-awake over 20 minutes, then retry to sleep when drowsy.
- Keep a sleep diary to track naps, sleep times, and other activities to find patterns and target problem areas for change when sleep patterns are bad.
- Use Sleep Hygiene Suggestions list.
