Despite the health care transformation efforts of this decade, the US healthcare system continues to be fragmented, expensive, and ineffective at addressing the root causes of individual and population health. Healthcare systems and providers are expanding the focus of clinical care models to optimize health and well-being through community-based models of care incorporating the social determinates of health (SDH), which are contributing causes of illness and indicators of morbidity and mortality.

The Affordable Care Act of 2010 provided unprecedented opportunities for healthcare reform and health professions education. The Triple Aim Initiative framed three goals: (1) Improve the patient experience of care, including quality and satisfaction, (2) Improve the health of populations, and (3) Reduce the per capita cost of health care. In response, Oregon has been a leader in testing new health systems and community-based models of care through coordinated care organizations (CCOs). Based on evaluation of key metrics and consistent with national priorities, the state is progressing to CCO 2.0, with an expanded focus on the integration of SDH and health equity.

**The I-CAN Model**

Oregon Health and Science University has developed the Interprofessional Care Access Network (I-CAN).

I-CAN is an innovative model that:
- Focuses on SDH, which influence prevention and chronic disease management;
- Provides care coordination under supervision of a nurse faculty-in-residence in a community faculty practice role;
- Engages interprofessional student teams in community-based health assessment and intervention;
- Maintains long-term commitments to community partners and clients;
- Is neighborhood and community-based, supporting relationships among local agencies and connecting clients to services in their own communities;
- Identifies population health issues specific to neighborhoods and communities through engagement with individuals and families, and collaborates with community partners to prioritize interventions cultivated over time and across academic terms.

"It is clear that the students learn a great deal about the lives and needs of low-income families. The students provide tremendous support, assistance and reassurance to our families.
— Susan Bash, Southern Oregon Head Start, West Medford Neighborhood"

**Neighborhood Community Academic Practice Partnerships (NCAPP)**

I-CAN was established in 2013 and serves diverse urban, rural and frontier communities in collaboration with local partner agencies. NCAPP partners in each community share services, refer clients, and participate in regular meetings and evaluation activities.
Community partners include federally-qualified health centers (FQHC’s), community dental clinics and social service agencies. I-CAN addresses client and population health needs through the work of interprofessional faculty-supervised student teams from OHSU’s Schools of Nursing, Dentistry, Medicine, and the Graduate Program in Human Nutrition.

The I-CAN Program

Nursing faculty-in-residence (FIR) collaborate with community partners to identify and refer clients who are poorly served by the healthcare system, have complex medical needs, and would benefit from care coordination services. Typically, individuals have multiple chronic illnesses and adverse social factors impacting their health. They may lack a primary care home, healthcare insurance, or stable housing. Most live beneath the poverty line and are socially isolated.

Outcomes. I-CAN has demonstrated positive impact on at least three critical indicators as identified by Oregon’s Coordinated Care Organizations: reduced ED visits, EMS calls, and hospitalizations (2018 – 2019, n = 108). The I-CAN program has seen substantial improvements in many social domains: after 14 weeks in I-CAN, clients were 1.78 times more likely to be secure with regard to medication management, 1.69 times more likely to be secure with regard to medication literacy, 2.07 times more likely to be secure with regard to medication management, 1.69 times more likely to be secure with regard to housing, and 1.95 times more likely to be secure with regard to food access (2015 - 2020, n = 279).

Evaluation

Methods. I-CAN uses a mixed-methods approach to evaluation. Quantitative data are collected at baseline, on every twelfth visit, and on exit. Data collected include demographic and healthcare utilization measures, as well as an established inventory focused on social determinants of health, medication and pain management, mental and oral health. Qualitative data include narrative documentation of student interactions with participants and participant satisfaction surveys.

Clients. On admission to I-CAN, 8% of clients lacked health insurance and 10% had unstable housing (defined as shelter, not housed, or friend’s home). Of all I-CAN clients, when asked about the 6 months prior to participation, 49% had been to the ER, 31% had called EMS at least once, and 33% reported at least one hospitalization. (2013 – 2020, n = 399).

Evaluation has shown increased competency in team-based decision making and team functioning.

Dissemination

The I-CAN program has supported poster and podium presentations by interprofessional faculty, students and community partners at over 50 state, national and international conferences.

Future of I-CAN

The success of I-CAN in improving health outcomes has led to new collaborations and data sharing with Oregon CCOs and other community partners. I-CAN is consistently building new partnerships and working to improve the health of our communities.

---

I could not have lived the last 3 months without you. We loved having you at our home. I learned so much. Thank you. – I-CAN client

I-CAN was an incredibly valuable experience for me as a future nurse. I learned more about myself and how to work as a team member than I ever imagined. I am beyond grateful for this opportunity and will value it as I move forward with my career. – I-CAN Student
