Do This, Don’t Do That

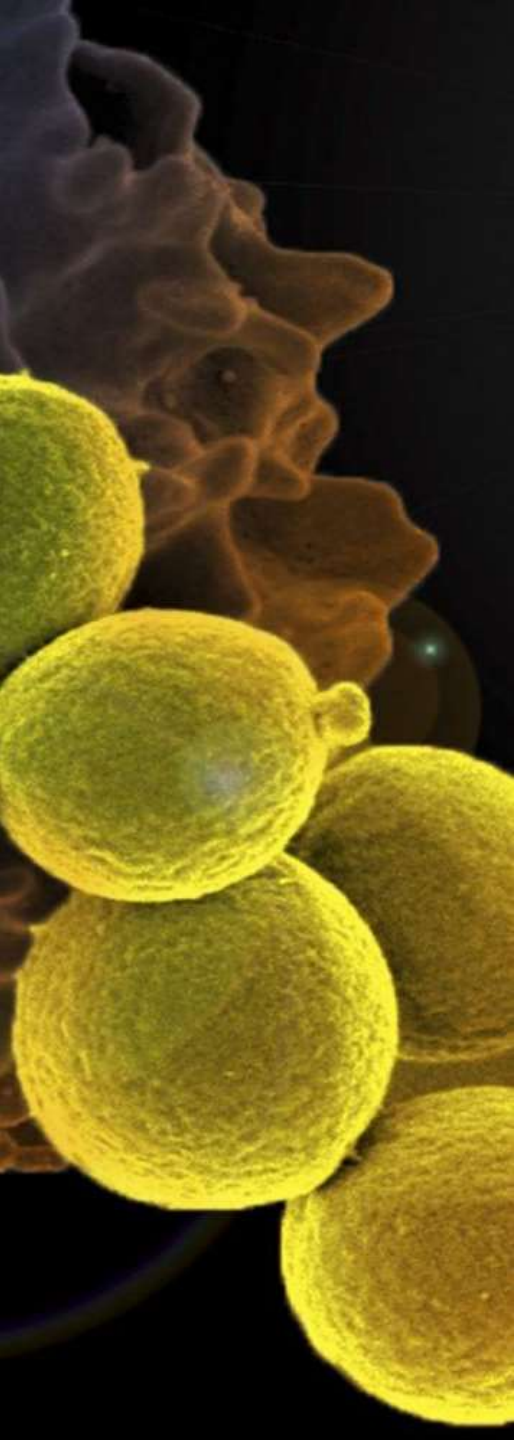
Infectious Diseases Edition

DATE: SEPTEMBER 2022 PRESENTED BY: ERIN BONURA, MD, MCR

Objectives for the next 30 min

- By the end of this session, the audience will be able to state
  - State the key indicators for complicated staphylococcus aureus bacteremia (SAB)
  - Identify the oral treatment options for SAB
  - State the indications for dalbavancin
  - State the epidemiology of hMPXV and identify the errors in messaging.

OHSU



Question 1: Sam Adams

Mr. SA is a 64 year old man with diabetes who presents with fevers, chills, and generally feeling unwell. His exam is remarkable for a temp of 38.4 C, HR 98, BP 160/84, RR 16 PO2 98%RA. He appears unwell but not toxic. Only notable exam finding is a II/VI murmur that he says is old. Blood cultures are obtained and grown MSSA the next day. He is placed on Cefazolin and defervesce on day 2. Cultures at 48 hours are positive but negative at 96.

Which of the following is most correct?

a) The patient should be treated for 2 weeks

b) The patient should have a TEE

c) The most predictive indicator is lack of fever at 72 hours

d) The patient should be treated with Nafcillin instead

OHSU

SUPPLEMENT ARTICLE

Staphylococcus aureus Bloodstream Infections: Definitions and Treatment

G. Ralph Corey
Duke University Medical Center, Durham, North Carolina

This supplement is based on the proceedings of a Novartis-sponsored session at the 9th International Symposium of Modern Concepts in Endocarditis and Cardiovascular Infections, June 2007; for sponsorship details, see p. S258.

- **Uncomplicated = negative follow up cultures, defervescence in 72 hours, normal TEE, no prosthetic material (joints, IV), no symptoms of metastatic disease**
- **Catheter associated… variable**
- **Clinical Infectious Diseases 2009; 48:S254–9**

OHSU

Do This

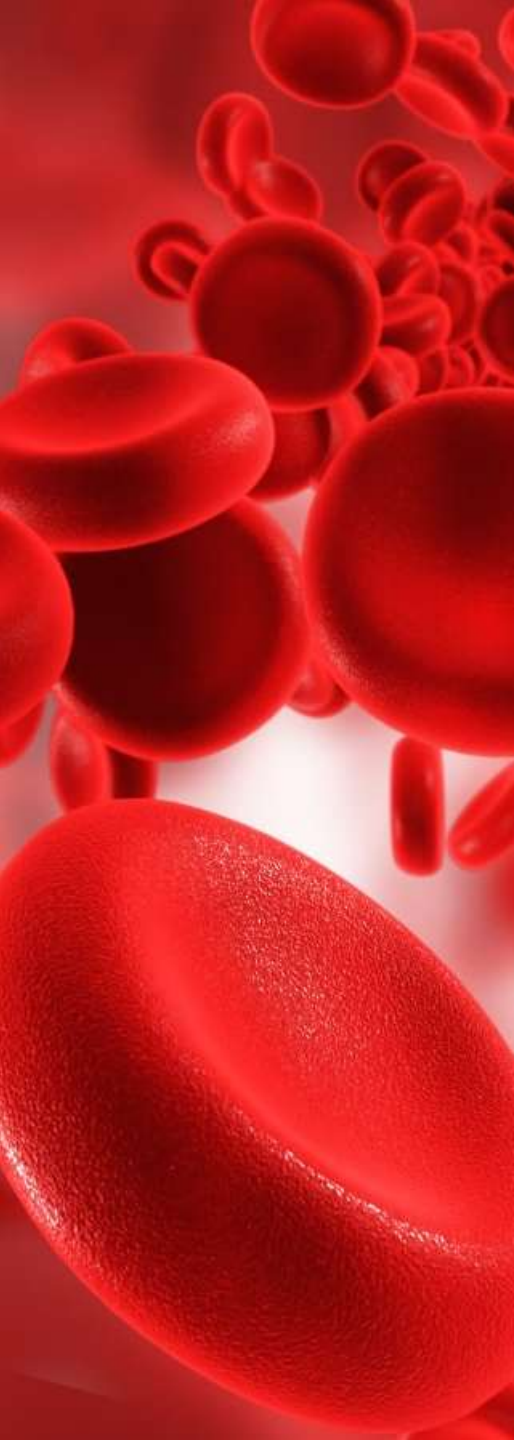
- Check for metastatic sites of infection and prosthetic material
- Note the date of defervescence
- Get daily cultures initially
- Order a TTE
- Treat at least 2 weeks

Don't Do That

- Don't treat SAB <2 weeks
- Don't disregard aches/Pains
- Don't demand TEE

Ok, we are going to treat a LONG time…

But, do we have to use IV?



Question 2: Igor Villanueva

“ Mr. IV is 42 year old man with obesity who presents with pain in his right leg. He states it started 3 days ago and has progressively gotten more warm and red. On exam he has a temperature of 38C, HR 88, BP 142/68, RR 14 and pO2 10% RA. His RLE is erythematous from ankle to tibial tuberosity with pain upon palpation. No bullae noted, no purulence. Cultures are dawn and he is started on vancomycin. The next day cultures return for MRSA. Repeat cultures at 48 hours are negative and the patient slowly improves. ”

What would you suggest?

A. Treat with cefazolin x 2 weeks
B. Treat with vancomycin x 4 weeks.
C. Treat with linezolid x 2 weeks
D. Treat with clindamycin x 4 weeks.

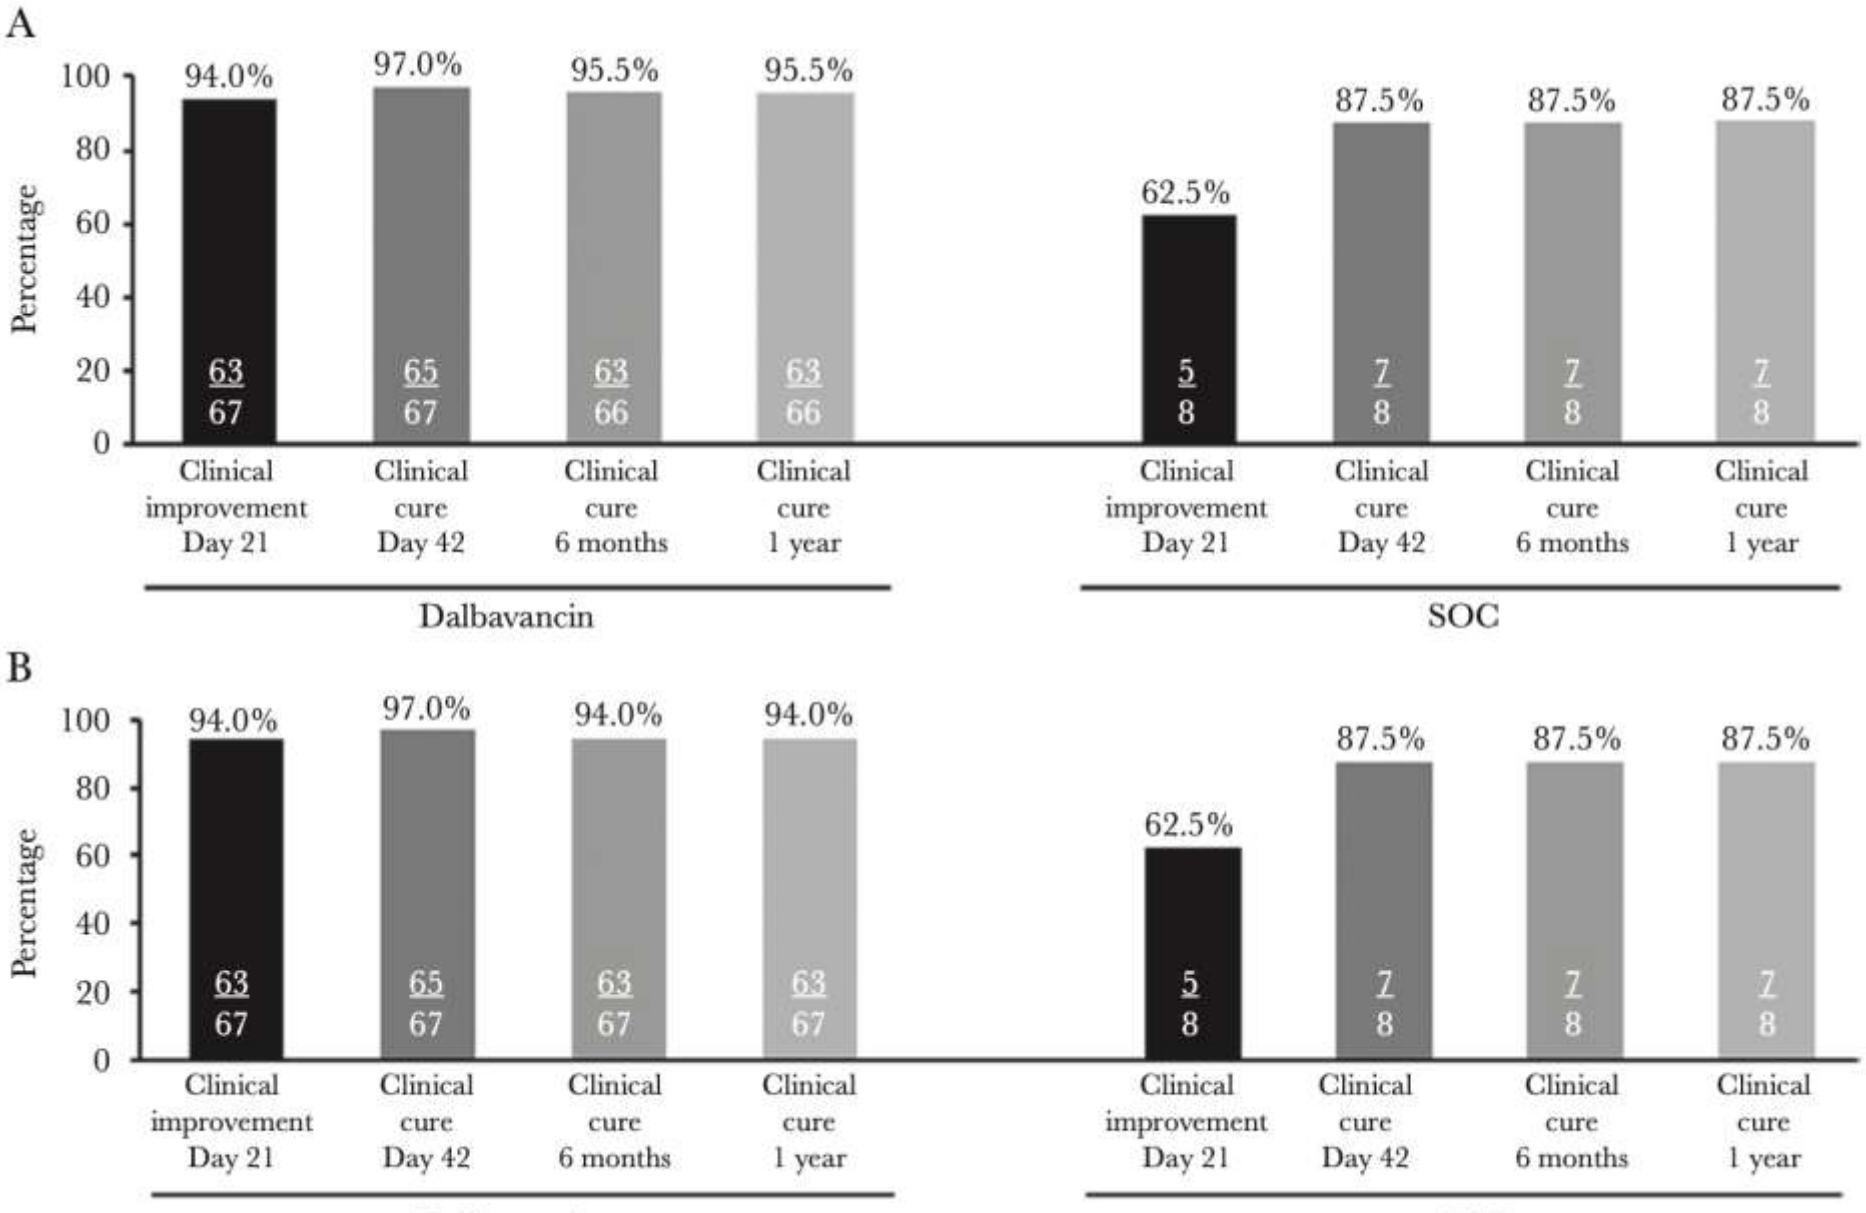
“Ok, so how about Dalbavancin”

Dalbavancin in Osteomyelitis



STUDY PROTOCOL Open Access

Dalbavancin as an option for treatment of *S. aureus* bacteremia (DOTS): study protocol for a phase 2b, multicenter, randomized, open-label clinical trial

Nicholas A. Turner[1], Smitha Zaharoff[2], Heather King[3,4], Scott Evans[5], Toshimitsu Hamasaki[5], Thomas Lodise[6], Varduhi Ghazaryan[7], Tatiana Beresnev[7], Todd Riccobene[8], Rinal Patel[8], Sarah B. Doernberg[9], Urania Rappo[10], Vance G. Fowler Jr[1], Thomas L. Holland[1*] and on behalf of the Antibacterial Resistance Leadership Group (ARLG)

- 200 adults with SAB including R sided IE!
- On effective therapy 3-10 days and CLEARANCE
- Desirability of Outcome Ranking (DOOR) at Day 70 of dalbavancin

OHSU

DOTS

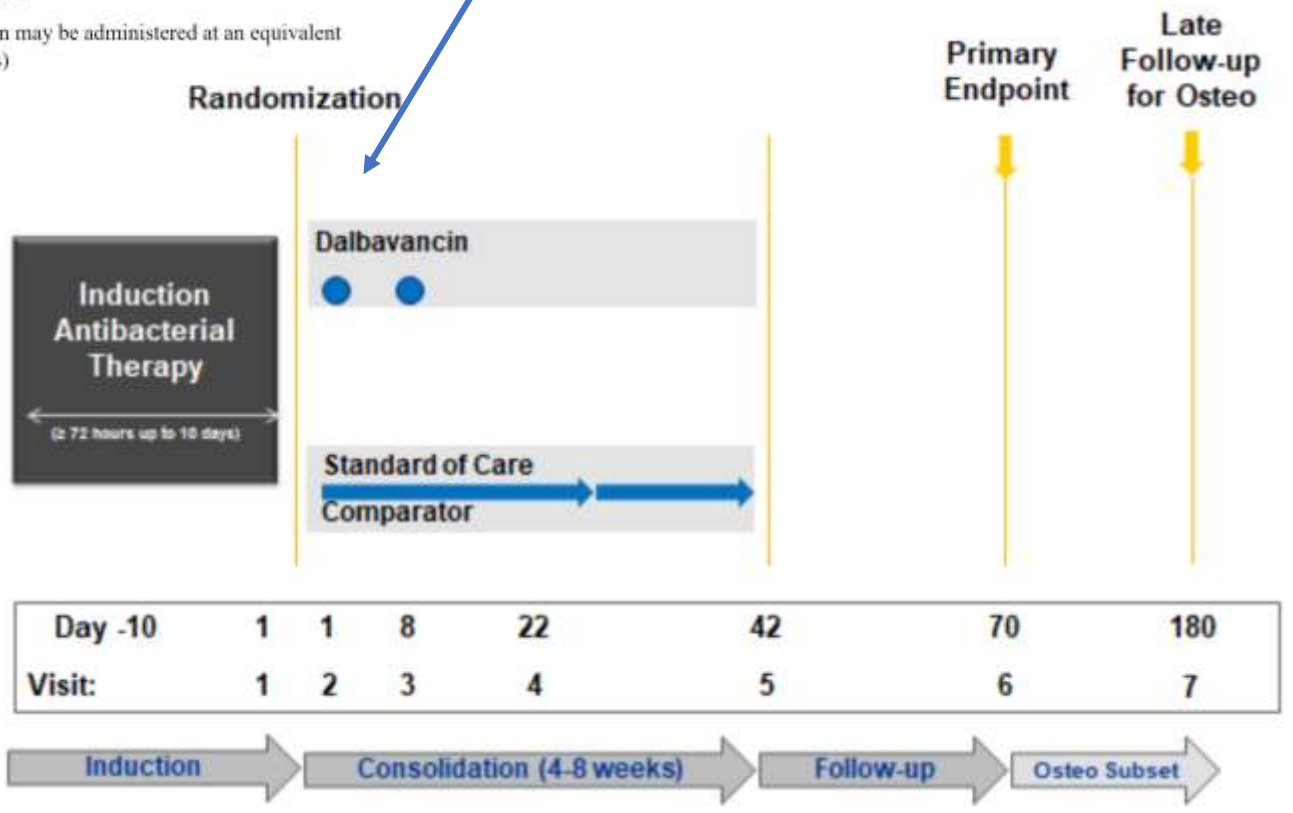
Table 1: Treatment Arms

Dalbavancin	100 subjects	Dalbavancin 1500 mg IV over 30 (± 10) minutes on Day 1 and 1500 mg IV over 30 (± 10) minutes on Day 8, renally dose-adjusted to 1125 mg for subjects with CrCl <30 and not on dialysis
Standard of Care[a]	100 subjects	• Methicillin-sensitive *Staphylococcus aureus* (MSSA): nafcillin (2 g IV q4h × 4-6 weeks)[b] OR oxacillin (2 g IV Q4h x 4-6 weeks)[b] OR cefazolin (2 g IV q8h × 4-6 weeks) • Methicillin-resistant *Staphylococcus aureus* (MRSA): vancomycin (dose per local standard of care × 4-6 weeks) OR daptomycin (6-10 mg/kg IV daily × 4-6 weeks)

[a]Renally dose-adjusted as appropriate, per local standard of care

[b]As applicable per site standard of care, nafcillin and oxacillin may be administered at an equivalent dose via continuous IV infusion (e.g., 12g/24h IV continuous)

*Whatever active abx therapy was started by primary team for 72hrs-10d prior to enrollment



Slide curtesy of Dr. Strnad PI OHSU

Do This

- Consider Linezolid for uncomplicated SAB
- Consider oral step down to complete SAB therapy
- Watch for Dalba studies

Don't Do That

- Don't treat SAB with oral beta-lactams *unless* ID input
- Don't treat SAB with dalba as first line, yet

OHSU

Question 1: Mr. Pock

"I have this patient, Mr. Pock, who is a 23 year old man with no medical history who presented to my clinic with fevers and a new vesicular rash. He said that he developed the fever about 3 days ago then the rash appeared. The rash had round patches that turned into bubbles. He is a graphic designer who works from home. His partner developed a similar condition last week. He was febrile and his skin exam was notable for vesicles concentrated on palms, buttocks, and face though dispersed throughout all in the same stage of development. No crusting. Could this be monkeypox?"

What would be an appropriate response?

A. Possibly, he should be placed in droplet and contact isolation

B. Possibly, he should be given the vaccinia vaccine

C. Possibly but more likely he has Varicella virus and requires supportive care

D. Possibly, he should have a PCR sent for monkeypox DNA

When to suspect…

- New characteristic rash **OR**
- Meets one epidemiologic criteria **AND**
- High clinical suspicion for monkeypox

- Contact with person w/ similar rash or + monkeypox
- Close contact within social network experiencing monkeypox activity
  - MSM who meet partners online or through social
- Traveled outside US to area with confirmed cases or where endemic
- Contact with animal or animal product known to harbor monkeypox
