Oregon

OVERALL - SENIOR RANK: 12  |  NO CHANGE
DETERMINANTS RANK: 9
OUTCOMES RANK: 24

STRENGTHS

- Low percentage of ICU use
- Low percentage of hospital readmissions
- High SNAP enrollment

CHALLENGES

- High prevalence of excessive drinking
- Low percentage of able-bodied seniors
- Low flu vaccination coverage

HIGHLIGHTS

- In the past year, pain management increased 16% from 47.3% to 54.8% of adults aged 65+ with arthritis
- In the past two years, low-care nursing home residents increased 31% from 6.5% to 8.5% of residents
- In the past two years, health screenings increased 21% from 61.1% to 74.0% of seniors receiving recommended screenings
- In the past three years, flu vaccination coverage increased 6% from 53.9% to 56.9% of adults aged 65+
- Since 2013, obesity increased 17% from 24.6% to 28.9% of adults aged 65+
- Since 2013, preventable hospitalizations decreased 22% from 42.9 to 33.4 discharges per 1,000 Medicare enrollees

Top 5 States

1: MINNESOTA  2: UTAH  3: HAWAII  4: COLORADO  5: NEW HAMPSHIRE
Smoking damages nearly every organ and causes such diseases as cataracts, respiratory disease, heart disease, stroke and cancer. It is also associated with accelerated cognitive decline, dementia and early cognitive impairment. Adults aged 65 years and older experience a higher prevalence of chronic obstructive pulmonary disease (COPD) than younger adults, and smoking causes about 80 percent of all COPD deaths. Smoking is the leading cause of preventable death in the United States. Cigarette smoking and secondhand smoke account for an estimated 480,000 deaths yearly and an additional 8.6 million people have a serious smoking-related illness.
Obesity contributes to cognitive decline, heart disease, diabetes, stroke and certain cancers. Recent research suggests that the strength of the association between obesity and mortality risk increases with age. The causes of obesity are complex and include lifestyle, social and physical environment, genetics and medical history. Obese seniors experience more hospitalizations, emergency department visits and use of outpatient health services than non-obese seniors. Older adults are more likely to have poor diet and decreased physical activity that contribute to obesity. Growing evidence illustrates the importance of the built environment and community design in promoting a healthy lifestyle.

Race and ethnicity populations are as defined by the original source.
Older adults are less likely to meet aerobic and muscle-strengthening physical activity recommendations than younger adults. Aging causes muscle mass and strength to decrease, which may challenge older adults to remain active. Physical inactivity increases the risk of cardiovascular disease, cancer, diabetes, hypertension, obesity and premature death. Increasing physical activity prevents and helps manage numerous chronic diseases. Physical activity has also been shown to increase bone density, reduce falls, prevent memory loss and decrease depression. Growing evidence illustrates the importance of environment and community design to promote physical activity for seniors.
Frequent Mental Distress (FMD) is characterized by 14 or more days of self-reported poor mental health in the past month, and emphasizes the burden of chronic and likely severe mental health issues in a population. Older adults with FMD are more likely to engage in behaviors that contribute to poor health such as smoking, physical inactivity and poor diet. Activity limitations due to physical, mental or emotional problems, as well as avoidance of medical care due to cost are associated with FMD in older adults. Chronic and severe mental health episodes are treatable and may be preventable through simple, cost-effective and time-efficient screening procedures, early interventions and quality care.
Dedicated Health Care Provider - Seniors

Seniors with a dedicated health care provider are better positioned to receive care that can prevent, detect and manage health conditions. Having a primary care provider is associated with greater patient-provider communication and trust, and an increased likelihood that patients will receive appropriate care. Older adults who live in areas with a larger primary care physician workforce are less likely to be hospitalized for preventable reasons and have lower death rates than those living in areas with fewer primary care physicians. Having a regular health care provider has been associated with lower health care costs, and improvements in overall health status and chronic care management for asthma, hypertension and diabetes.
Oral health naturally declines with age, and problems arise if routine care is not maintained. Poor oral health can have a large impact on quality of life by negatively affecting the ability to chew, speak and interact socially, in addition to increasing the risk for certain diseases such as diabetes and oral cancer. Most individuals lose dental insurance coverage when they retire, and Medicare generally does not cover dental care. This means the majority of seniors pay out-of-pocket for most or all dental expenses, which impacts dental care use. Evidence indicates that older adults who use preventive dental care reduce their dental bills and out-of-pocket payments.
### Trend: Food Insecurity - Seniors, Oregon, United States

Percentage of adults aged 60 years and older who faced the threat of hunger in the past 12 months
